

Postmortem INC-7203: orders-api disk full on the log volume

Date: February 2026. Duration: 106 minutes. Severity: SEV2.

Summary

Customers saw errors from orders-api for 106 minutes. The trigger was disk full on the log volume.

Timeline

09:12 alert fired. 09:20 incident declared. 09:56 mitigation applied.

Root cause

A change merged two days earlier removed a safety limit, so disk full on the log volume was able to build up unnoticed until peak traffic. Monitoring did not alert early because the threshold was set for the old traffic pattern.

Contributing factors

- The runbook pointed to a dashboard that had been renamed.
- The canary stage was skipped for a config-only change.

Action items

- AI-489: restore the safety limit and add a regression test.
- AI-384: update the alert threshold to the new traffic pattern.
- AI-564: never skip the canary, including for config changes.
